I receive an error message if trying to set a trap destination

Christoph Strauss - 2023-02-02 - Gecko

If you try to set a trap destination in your GECKO you might get an error message "invalid IP address".

This usually happens if you have updated your GECKO from firmware versions <02.3.x. The reason for this are the pre-populated fields with 0.0.0.0. The default values have been changed and as of 02.3.x the trap receiver IP address is empty by default. As a workaround you can delete all entries with 0.0.0.0 and then set your intended trap receiver IP.

If you start from factory defaults in v02.3.x this does not show up.

The screenshot shows the Hirschmann web interface for configuring Alarms (Traps). The main content area is titled "Alarms (Traps)" and contains a table for "Destination Addresses". The table has two columns: "IP Address" and "Trap Community". The first row has "172.16.20.143" and "public". The second row has "0.0.0.0" and "public". The third row has "0.0.0.0" and "public". The fourth row has "0.0.0.0" and "public". The fifth row has "0.0.0.0" and "public". The sixth row has "0.0.0.0" and "public". The seventh row has "0.0.0.0" and "public". The eighth row has "0.0.0.0" and "public". An error dialog box is open in the foreground, displaying a red "X" icon and the text "Error Invalid IP Address". The dialog box has an "OK" button. At the bottom of the page, there are "Reload" and "Set" buttons, and a "Help" icon in the bottom right corner.
