I receive an error message if trying to set a trap destination

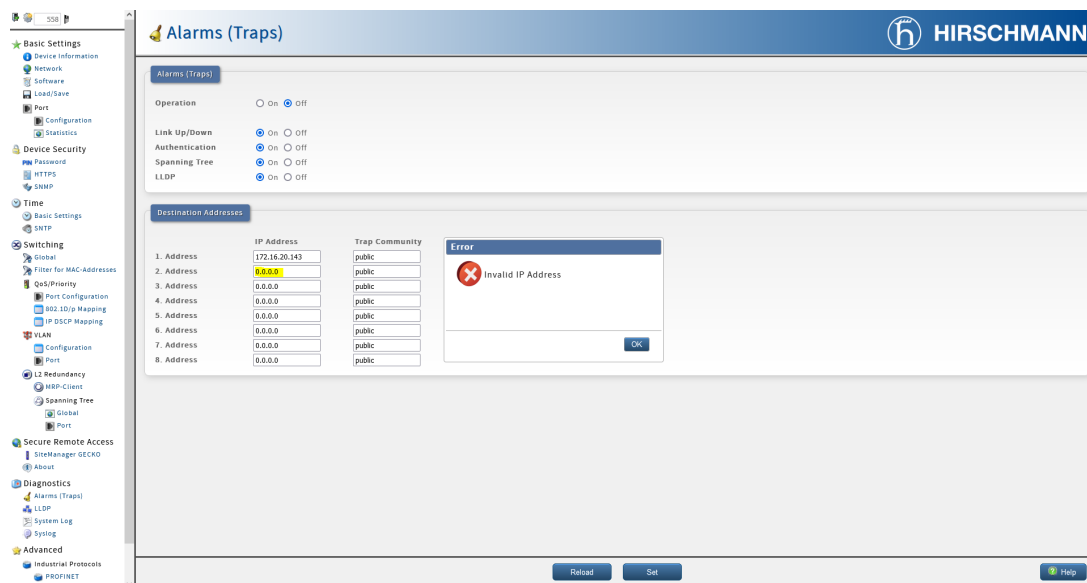

Christoph Strauss - 2023-02-02 - Gecko

If you try to set a trap destination in your GECKO you might get an error message "invalid IP address".

This usually happens if you have updated your GECKO from firmware versions <02.3.x.

The reason for this are the pre-populated fields with 0.0.0.0. The default values have been changed and as of 02.3.x the trap receiver IP address is empty by default. As a workaround you can delete all entries with 0.0.0.0 and then set your intended trap receiver IP.

If you start from factory defaults in v02.3.x this does not show up.

The screenshot shows the Hirschmann web interface for configuring Alarms (Traps). The main content area is titled "Alarms (Traps)" and features a sidebar on the left with various configuration categories. The "Destination Addresses" section contains a table with 8 rows, each with "IP Address" and "Trap Community" columns. The first row has IP "172.16.20.143" and "public". The second row has IP "0.0.0.0" and "public". The remaining rows also have "0.0.0.0" and "public". An error dialog box is overlaid on the table, displaying a red "X" icon and the text "Error Invalid IP Address" with an "OK" button.

	IP Address	Trap Community
1. Address	172.16.20.143	public
2. Address	0.0.0.0	public
3. Address	0.0.0.0	public
4. Address	0.0.0.0	public
5. Address	0.0.0.0	public
6. Address	0.0.0.0	public
7. Address	0.0.0.0	public
8. Address	0.0.0.0	public
