

I receive an error message if trying to set a trap destination

Christoph Strauss - 2023-02-02 - Gecko

If you try to set a trap destination in your GECKO you might get an error message "invalid IP address".

This usually happens if you have updated your GECKO from firmware versions <02.3.x. The reason for this are the pre-populated fields with 0.0.0.0. The default values have been changed and as of 02.3.x the trap receiver IP address is empty by default. As a workaround you can delete all entries with 0.0.0.0 and then set your intended trap receiver IP.

If you start from factory defaults in v02.3.x this does not show up.

The screenshot shows the 'Alarms (Traps)' configuration page in the Hirschmann web interface. The page is divided into several sections:

- Operation:** Includes radio buttons for 'On' and 'Off' for various settings like Link Up/Down, Authentication, Spanning Tree, and LLDP.
- Destination Addresses:** A table with two columns: 'IP Address' and 'Trap Community'. It contains 8 rows, with the first row having '172.16.20.143' and 'public', and the remaining 7 rows having '0.0.0.0' and 'public'.
- Error Dialog:** A modal window titled 'Error' with a red 'X' icon and the text 'Invalid IP Address'. It has an 'OK' button.

At the bottom of the page, there are 'Reload' and 'Set' buttons, and a 'Help' icon in the bottom right corner.
